SUMMARY

MCA student at BIT Mesra seeking a software development internship in AI and computer vision: turns stakeholder needs into products real users adopt, and contributes to open-source AI projects.

EDUCATION

- MCA (Master of Computer Applications), Birla Institute of Technology, Mesra *In progress, expected 2028*
- BCA (Bachelor of Computer Applications), Birla Institute of Technology, Mesra *Graduated May 2026*

EXPERIENCE

Software Development Intern at Birla Institute of Technology, Mesra, Ranchi *Jun 2024 to Jul 2024*

- Rolled out a computer-vision attendance system for faculty and admin staff, cutting manual attendance tracking time by about 30% (Python, OpenCV, Docker).
- Gathered requirements directly from senior faculty, shaping the system around how they actually take attendance.
- Built an analytics dashboard that gave faculty a clear view of classroom activity (React).
- Automated attendance log processing with scheduled jobs, saving each staff member about an hour a week (Python).

OPEN SOURCE

Open Source Contributor at OpenClaw

- Built a messaging integration and tool-calling fixes for OpenClaw, an open-source AI agent platform, accepted after maintainer review.

Open Source Contributor at Roboflow

- Documented how to evaluate Hugging Face DETR models in Roboflow's supervision by converting PyTorch DataLoader targets into sv.Detections for mAP and confusion-matrix metrics, revised per maintainer review.

PROJECTS

Yavin: AI code editor where developers write, test and review code in one place

- Built a desktop code editor whose AI suggestions draw on the user's own codebase rather than generic examples (React, Python, RAG).
- Added a review screen that shows every AI change side by side, so users stay in control of what gets accepted.
- Designed a built-in test panel that lets developers find, run, stop and inspect their tests without leaving the editor (TypeScript, Vitest, Jest).
- Built the secure engine that runs those tests, blocking unsafe commands and any file access outside the user's project (Rust, Tauri).
- Made test runs dependable with time limits, clean cancellation and crash handling, verified by 58 automated tests.

Scarif: database service that spreads data across servers to handle growth

- Built a SQL database split across 10 nodes, each packaged for repeatable deployment (Docker, GCP).
- Exposed the data through an API layer and balanced traffic so no single node becomes a bottleneck.
- Set up health alerts that flag node failures early, before users notice (Cloud Monitoring).

SKILLS

Business: Stakeholder communication, requirements gathering, user onboarding and rollout, technical documentation

AI & Agents: LangGraph, CrewAI, MCP, RAG, LLM API integration, OpenCV, Roboflow

Languages & Frameworks: Python, TypeScript, JavaScript (ES6+), Rust, SQL, Java, HTML/CSS, FastAPI, Flask, Node.js, Express, React.js, Tauri, Electron, REST APIs, MongoDB

Cloud & DevOps: Google Cloud (Cloud Run, Cloud Storage, Cloud Monitoring), Docker, GitHub Actions, Git, Postman
